

Option B: Stop RDS temporarily

1. Stop the RDS instance:

```
aws rds stop-db-instance --db-instance-identifier lab-mysql
```

1. Wait for status to change to "stopped" (takes a few minutes):

```
aws rds describe-db-instances \  
  --db-instance-identifier lab-mysql \  
  --query "DBInstances[0].DBInstanceStatus"
```

1. Trigger your app:

```
curl http://<EC2_PUBLIC_IP>/list
```

1. To restore later:

```
aws rds start-db-instance --db-instance-identifier lab-mysql
```

Warning: RDS takes 5-10 minutes to stop and start. This method is slower but more realistic.

Option C: Credential mismatch (change Secrets Manager password)

1. Update the secret with a wrong password:

```
aws secretsmanager update-secret \  
  --secret-id lab/rds/mysql \  
  --secret-string '{"username":"admin","password":"WRONGPASSW"
```

```
ORD", "host": "lab-mysql.chkce02amfxr.us-east-2.rds.amazonaws.com", "port": "3306"}'
```

1. **Restart your app** (so it picks up the new, wrong credentials)
2. **Trigger your app:**

```
curl http://<EC2_PUBLIC_IP>/list
```

1. **To restore later:** Update the secret back to the correct password.
